

Table 21: Country ID Options

Option	Description
Country ID	Mode Specifies whether to always use the specified Country Name or to run Country ID processing. The options are available: • Constant – Assumes all of your input data is for the specified Country Name and does not run Country ID processing. Choose this option only if all of your data is from one country. This option may save processing time. • Assigned – Runs Country ID processing. Choose this option if the input data is from more than one country. For example, choose <i>Country ID Mode</i> if one of these scenarios applies: - You use two or more of the engines and your input addresses contain country data. - You use only one engine and your input source contains many addresses that cannot be processed by that engine. Any addresses that cannot be processed are not sent to the engine and the transform use the <i>Country_Name</i> option value as the default country.
Country Name	Specifies the country of destination. These options are available: • None: Select when the <i>Country ID Mode</i> is set to <i>Assigned</i> and you do not want a default country to be set when the country cannot be identified. • Special considerations: - If the <i>Country ID Mode</i> is set to <i>Constant</i>, choose the country of destination from the <i>Country Name</i> list. The transform assumes that all of your data is for this country.
